

JOSEPH EZEKIEL Backend Software Engineer

✉ theolujay@gmail.com ☎ +234-902-139-0950 🌐 github.com/theolujay 🔗 theolujay.dev 🌐 linkedin.com/in/theolujay

Backend engineer building and operating production systems with **Go, Python, and TypeScript**. Experienced with API design, PostgreSQL, Redis, Docker, CI/CD, payments, asynchronous workloads, and production observability. Particularly interested in **distributed systems, infrastructure, networking, reliability, and performance engineering**.

TECHNICAL SKILLS

Languages: Go, Python, TypeScript/JavaScript, SQL • **Backend:** Django/DRF, FastAPI, Node.js/NestJS, REST, gRPC • **Data:** PostgreSQL, MongoDB, MySQL, Redis, CockroachDB • **Infrastructure:** Linux, Docker, Kubernetes, Ansible, Terraform, Traefik, GitHub Actions, AWS • **Observability:** OpenTelemetry, Prometheus, Grafana, Tempo, Loki

EXPERIENCE

Backend & Platform Engineer, [Retreev](#)

Jun 2026 – Present

- Built an event-photo platform that connects to Google Drive, creates searchable galleries, and lets attendees discover their photos using selfie-based face search; deployed across weddings, church events, and developer gatherings.
- Designed the backend and asynchronous image-indexing architecture with FastAPI, PostgreSQL, Google APIs, and decoupled ML inference services, including collections, access controls, analytics, and organizer workflows.
- Reworked performance-sensitive components in Go and separated inference behind service APIs to improve performance, maintainability, and deployment flexibility.
- Own system architecture, deployment, production operations, technical product decisions, customer onboarding, and engineering iteration.

Software Engineer, [Verboheit](#)

Oct 2024 – May 2026

- Designed, built, and maintain the backend for a national mathematics competition platform supporting candidate registration, multi-stage examinations, scoring, rankings, staff workflows, and real-time notifications.
- Built production services with Django/DRF, PostgreSQL, Redis, Celery, WebSockets, and AWS S3, including JWT/API-key authentication, OTP flows, RBAC, signed file access, and third-party integrations.
- Containerized and operated the production stack on Linux using Docker Compose and Traefik, with distributed tracing, metrics, and logs through OpenTelemetry, Prometheus, Grafana, Tempo, and Loki.
- Designed background workflows for automated scoring, leaderboard generation, notifications, and external exam-system synchronization while improving security, recoverability, and operational visibility.

SELECTED PROJECTS

[Appa](#), Self-hosted Deployment Platform

- Built a mini-PaaS whose CLI provisions and hardens VPS fleets using Ansible, then deploys applications from Git, ZIP, or local source using Railpack, BuildKit, and Caddy with automatic HTTPS.
- Engineered idempotent infrastructure playbooks and a WebSocket live-log system with a single goroutine coordinating broadcast state through channels to avoid lock contention during concurrent deployments.

[Resumable Upload Server](#)

Implemented a resumable file-upload server in Go based on the tus protocol, handling upload creation, offset validation, incremental PATCH requests, recovery from interrupted transfers, and protocol-compliant HTTP behavior.

[Paystack Python SDK](#)

Built and published a Python wrapper for Paystack APIs using TDD, achieving ~99% test coverage with automated CI and Codecov reporting.

EDUCATION

B.Eng. Mechatronics Engineering, Federal University of Agriculture, Abeokuta

Final Year Project: PLC-based Automated Car Wash System. Designed embedded control logic and integrated sensors and actuators for automated cycle management.
